

Presentation tier

Passengers and taxi drivers use the client applications to send request through the web. Clients perform input validation, send request to the server and show the response received from the server to the users.

Application tier

A server web receives the clients' requests and an application server performs the requested actions. If needed, the application server composes a query to ask the database and sends uses the result to complete the action.

Data tier

The database stores and manages all the data required to perform the service. It receives query from the logic layer, computes the answer and sends back the result.
